

1. A car of mass 1500 kg is moving up a straight road, which is inclined at an angle  $\theta$  to the horizontal, where  $\sin \theta = \frac{1}{14}$ . The resistance to the motion of the car from non-gravitational forces is constant and is modelled as a single constant force of magnitude 650 N. The car's engine is working at a rate of 30 kW.

Find the acceleration of the car at the instant when its speed is  $15 \text{ m s}^{-1}$ .

**Figure 1**

Figure 1 shows a ladder  $AB$ , of mass 25 kg and length 4 m, resting in equilibrium with one end  $A$  on rough horizontal ground and the other end  $B$  against a smooth vertical wall. The ladder is in a vertical plane perpendicular to the wall. The coefficient of friction between the ladder and the ground is  $\frac{11}{25}$ . The ladder makes an angle  $\beta$  with the ground. When Reece, who has mass 75 kg, stands at the point  $C$  on the ladder, where  $AC = 2.8$  m, the ladder is on the point of slipping. The ladder is modelled as a uniform rod and Reece is modelled as a particle.

- (a) Find the magnitude of the frictional force of the ground on the ladder. (3)
- (b) Find, to the nearest degree, the value of  $\beta$ . (6)
- (c) State how you have used the modelling assumption that Reece is a particle. (1)

3. A block of mass 10 kg is pulled along a straight horizontal road by a constant horizontal force of magnitude 70 N in the direction of the road. The block moves in a straight line passing through two points  $A$  and  $B$  on the road, where  $AB = 50$  m. The block is modelled as a particle and the road is modelled as a rough plane. The coefficient of friction between the block and the road is  $\frac{4}{7}$ .

(a) Calculate the work done against friction in moving the block from  $A$  to  $B$ .

(4)

The block passes through  $A$  with a speed of  $2 \text{ m s}^{-1}$ .

(b) Find the speed of the block at  $B$ .

4. A particle  $P$  moves along the  $x$ -axis in a straight line so that, at time  $t$  seconds, the velocity of  $P$  is  $v \text{ m s}^{-1}$ , where

$$v = \begin{cases} 10t - 2t^2, & 0 \leq t \leq 6, \\ \frac{-432}{t^2}, & t > 6. \end{cases}$$

At  $t = 0$ ,  $P$  is at the origin  $O$ . Find the displacement of  $P$  from  $O$  when

- (a)  $t = 6$ ,

(3)

- (b)  $t = 10$ .

**Figure 2**

A uniform lamina  $ABCD$  is made by joining a uniform triangular lamina  $ABD$  to a uniform semi-circular lamina  $DBC$ , of the same material, along the edge  $BD$ , as shown in Figure 2. Triangle  $ABD$  is right-angled at  $D$  and  $AD = 18 \text{ cm}$ . The semi-circle has diameter  $BD$  and  $BD = 12 \text{ cm}$ .

- (a) Show that, to 3 significant figures, the distance of the centre of mass of the lamina  $ABCD$  from  $AD$  is  $4.69 \text{ cm}$ .

(4)

Given that the centre of mass of a uniform semicircular lamina, radius  $r$ , is at a distance  $\frac{4r}{3\pi}$  from the centre of the bounding diameter,

- (b) find, in cm to 3 significant figures, the distance of the centre of mass of the lamina  $ABCD$  from  $BD$ .

(4)

The lamina is freely suspended from  $B$  and hangs in equilibrium.

- (c) Find, to the nearest degree, the angle which  $BD$  makes with the vertical.

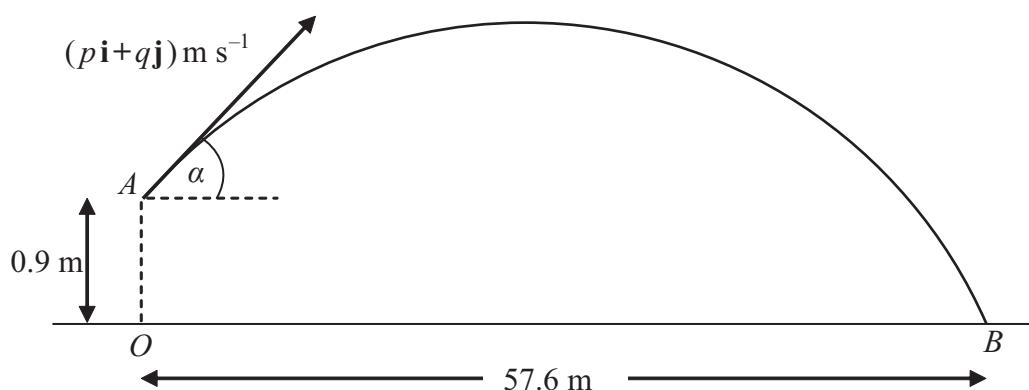

Figure 3

A cricket ball is hit from a point  $A$  with velocity of  $(p\mathbf{i} + q\mathbf{j}) \text{ m s}^{-1}$ , at an angle  $\alpha$  above the horizontal. The unit vectors  $\mathbf{i}$  and  $\mathbf{j}$  are respectively horizontal and vertically upwards. The point  $A$  is 0.9 m vertically above the point  $O$ , which is on horizontal ground.

The ball takes 3 seconds to travel from  $A$  to  $B$ , where  $B$  is on the ground and  $OB = 57.6 \text{ m}$ , as shown in Figure 3. By modelling the motion of the cricket ball as that of a particle moving freely under gravity,

- find the value of  $p$ , (2)
- show that  $q = 14.4$ , (3)
- find the initial speed of the cricket ball, (2)
- find the exact value of  $\tan \alpha$ . (1)
- Find the length of time for which the cricket ball is at least 4 m above the ground. (6)
- State an additional physical factor which may be taken into account in a refinement of the above model to make it more realistic. (1)

7. A particle  $P$  of mass  $3m$  is moving in a straight line with speed  $2u$  on a smooth horizontal table. It collides directly with another particle  $Q$  of mass  $2m$  which is moving with speed  $u$  in the opposite direction to  $P$ . The coefficient of restitution between  $P$  and  $Q$  is  $e$ .

(a) Show that the speed of  $Q$  immediately after the collision is  $\frac{1}{5}(9e + 4)u$ .

(5)

The speed of  $P$  immediately after the collision is  $\frac{1}{2}u$ .

(b) Show that  $e = \frac{1}{4}$ .

(4)

The collision between  $P$  and  $Q$  takes place at the point  $A$ . After the collision  $Q$  hits a smooth fixed vertical wall which is at right-angles to the direction of motion of  $Q$ . The distance from  $A$  to the wall is  $d$ .

(c) Show that  $P$  is a distance  $\frac{3}{5}d$  from the wall at the instant when  $Q$  hits the wall.

(4)

Particle  $Q$  rebounds from the wall and moves so as to collide directly with particle  $P$  at the point  $B$ . Given that the coefficient of restitution between  $Q$  and the wall is  $\frac{1}{5}$ ,

(d) find, in terms of  $d$ , the distance of the point  $B$  from the wall.
